**INTRODUCTION**

The latest revision of the genera *Satureja* L., *Clinopodium* L., *Micromeria* Bentham, *Calamintha* Mill. and *Acinos* Mill, based on modern molecular-phylogenetic studies, have led to many new taxonomic solutions, to new taxonomic and nomenclature combinations [1–9]. An attempt was made to clarify the boundaries between the different genera, as well as to determine the real taxonomic status and position of certain species and lower taxa within these genera. The taxonomic solutions based on the specific morphological characteristics at the level of the genera, sections, subsections or species, especially within the genera *Micromeria* and *Clinopodium*, in many cases were not very clear and precisely defined, followed by a very complex synonymy, as well as with the inevitable author subjectivism.

On the one hand, some species, depending on author’s taxonomic concept, have often changed their taxonomic and nomenclature status within the different genera [e.g. *Calamintha grandiflora* (L.) Moench, *Satureja grandiflora* (L.) Scheele, *Clinopodium grandiflorum* (L.) Kuntze], while on the other hand, some species described from the some parts of the Balkan Peninsula were neglected, such as *Clinopodium albanicum* (Griseb. ex K. Malý) Melnikov [*Micromeria albanica* (K. Malý) Šilić, *Satureja albanica* Griseb. ex K. Malý] and they were associated with related species from the other areas (*Micromeria serpyllifolia*).

Aim of the elaboration is to establish the adequate classification of the species of the genus *Clinopodium* found between Kichevo and Demir Hisar. As these species was often treated within different taxa (*Clinopodium albanicum*, *Clinopodium dalmaticum* subsp. *bulgaricum*, *Clinopodium serpyllifolium*) we tried to highlight also development of classification history of this species.

**EXPERIMENTAL SECTION**

Floristic researches were carried out in the western parts of the territory of the Republic of Macedonia (Demir Hisar, between the villages of Velmevci and Železnec). Herbarium material is deposited in the Herbarium of the Institute of Biology, Faculty of Natural Sciences and Mathematics in Skopje (MKNH). When determining the herbarium material, appropriate literature was consulted – *Prodromus Florae peninsulae Balcanicae*, II [10]; *Flora Europaea*, III [11] and other regional floras [12], as well as some special papers [1–9] and databases – Euro+Med Plant Base [13] dealing with taxonomy, nomenclature and chorology of the taxa studied.
RESULTS AND DISCUSSION

During our work on Lamiaceae family for the edition "The Flora of the Republic of Macedonia", special attention was paid to the species Clinopodium albanicum, which was discovered in the southwestern part of the territory of the Republic of Macedonia (between Kichevo and Demir Hisar) as well as his relationship with the species Clinopodium serpillifolium (Micromeria serpillifolia) and Micromeria bulgarica.

The western Balkan endemic species Clinopodium albanicum (Micromeria albanica, Satureja albanica) was discovered in the vicinity of Prizren, Kosovo, (sub. Micromeria albanica Griseb., Locus classicus: Resnathal = Rekathal bei Prizren, besides hfg. auf Kalkfelsen bei d. Ruinen d. Schlosses Demanitze, 1839; by A. Grisebach) [14].

From the chronological overview of the data cited in the botanical literature for the taxonomy, nomenclature and distribution of this species can be found the following:

Hayek [10] considers this species (as Satureja albanica) a synonym of the species Micromeria serpillifolia (MB) Briq, citing it only for the territory of Albania. But, it should be noted that Hayek’s territorial boundaries in Prodromus Florae peninsulae Balcanicae do not correspond with today’s state borders of the Balkan Peninsula countries.

Malý [15] points this species under the name Satureja albanica Griseb. ex K. Malý.

Chater & Guinea [11] in the Flora Europaea edition do not mention the species Satureja albanica Griseb. ex K. Malý [= Micromeria albanica (K. Malý) Šilić] et al. They cite the taxon Micromeria fruticosa (L.) Druce subsp. serpillifolia (Bieb.) P. H. Davis for Crimea, Southwestern Asia and Southwestern Yugoslavia, so according to this we can lead to the conclusion that the data for Southwestern Yugoslavia actually refers to Micromeria dalmatica.

Diklić [12] in the Flora of SR Serbia edition accepts the decision that Satureja albanica is a synonym of Micromeria serpillifolia MB, so cites it for Serbia: Kosovo – Prizrenska Bistrica.

Šilić [16] in his monograph dedicated to the genera Satureja L., Clinopodium L., Micromeria Bentham, Calamintha Mill. and Actinos Mill. in the flora of Yugoslavia, the status of the species Satureja albanica Griseb ex K. Malý was actualized and he confirm the independent status of the taxon and proposes the following nomenclature combination – Micromeria albanica (Griseb. ex K. Malý) Šilić stat. et comb. new. Close to the classical locali-
Clinopodium albanicum (Griseb. ex K. Malý) Melnikov new species for the flora of the Republic of Macedonia

Griseb. ex K. Malý ≡ Micromeria albanica (K. Malý) Šilić.

Of all the above, the question is whether the taxonomic status of the Clinopodium albanicum (Griseb. ex K. Malý) Melnikov (Satureja albanica, Micromeria albanica) is justified, or it is a synonym of Clinopodium serpyllifolium (M. Bieb.) Kuntze.

In clarifying this problem, we had extensive literature on these two species as well as a rich herbarium material from the Clinopodium albanicum, collected from the territory of the Republic of Macedonia, in the area of Demir Hisar (between the villages of Železnec and Velmeveci). In this respect, the monograph of Šilić [16], which provides an extensive diagnostic description of the species Micromeria albanica (based on the herbarium material from the canyon of the Bistrica river above Prizren), is particularly significant, with detailed morphological characteristics, ecology, inventory of the accompanying plant species registered on his habitat, drawings of the inflorescence, calyx, corolla, bracts, leaves, a photograph of the habitat of this species from its Locus classicus as well as its synonymy.

The analysis of the herbarium material from the area of Demir Hisar showed that the registered populations can not be linked to the species Micromeria bulgarica (Velen.) Vandas (according to modern concepts Clinopodium dalmaticum or Clinopodium dalmaticum subsp. bulgaricum), cited by Šilić [16], for the territory of the Republic of Macedonia (Demir Hisar, Usunja river and Krivska river) based on the data of Vandas [17, 18]. Namely, it should be noted that Šilić [16], in the absence of authentic herbarium material of Micromeria bulgarica from the territory of Macedonia, uses drawings of the most important morphological characteristics of this taxon using herbarium material from the territory of Bulgaria (Rodopi). There is a noticeable difference between these two taxa in the shape and the hairy of the leaves, as well as the size of the calyx and shape of the calyx-teeth. In the herbarium material of Clinopodium albanicum, originating from the territory of the Republic of Macedonia (calyx is regular, 2–2.5 mm long, the calyx-teeth are triangular, about as long as wide)(Figures 1, 3, 4) while in the Micromeria bulgarica (i.e. Clinopodium dalmaticum) originating from the territory of Bulgaria (calyx is longer than 3 mm, the calyx-teeth are elongated, lanceolate to subulate, much longer than wide, acute) (Figure 2).

As for the species Clinopodium serpyllifolium, with whom Clinopodium albanicum (= Micromeria albanica, Satureja albanica) was often linked, its range extends to the territory of Crimea, the Asian part of Turkey, Lebanon, Syria, Israel and Jordan, so the presence of this species on the territory of the Balkan Peninsula is excluded [19].

Figure 1. Clinopodium albanicum - calyx (MK: Demir Hisar:Železnec-Velmevc i)

Figure 2. Clinopodium dalmaticum subsp. bulgaricum - calyx (BG: Rodopi)

Melnikov [7] published a very important study devoted to the new sections of the genus Clinopodium, so that within the boundaries of this genus he described several new sections and subsections, which at the same time represent a solid basis for the solution of taxonomic and nomenclature problems at the supraspecies and spe-
cies level. Namely, Melnikov [7] distinguishes two separate sections that include the above-mentioned closely related species, which are however clearly morphologically and horologically differentiated. In the newly published Sect. *Pseudomelissa* (Benth.) Melnikov, whose representatives are characterized by a more or less irregular calyx with elongated calyx-teeth, he includes the species *Clinopodium dalmaticum* (*Micromeria bulgarica* is usually attached to this species as a subspecies or synonym). Melnikov [7], in the newly described Sect. *Brachyodontia* Melnikov, which differs from the Sect. *Pseudomelissa* with the almost regular calyx and equal triangular or wide-triangular calyx-teeth, about as long as wide, with short soft hairs on the stems, leaves, calyx and pedicels, separates two subsections – subsection. *Brachyodontia* and subsection. *Inkermenia* Melnikov. In subsection. *Brachyodontia*, stem hairs are retrorse (here the *Clinopodium albanicum* species is attached), while in the Subsect. *Inkermenia* stem hairs are directed upwards (includes the Crimean species *C. serpyllifolium*).

![Figure 3. Clinopodium albanicum – habitat of the species (MK: Demir Hisar:Železnec-Velmevci)](image1)

![Figure 4. Clinopodium albanicum – habitus of the species (MK: Demir Hisar:Železnec-Velmevci)](image2)
From the above, it could be concluded that the taxonomic status of the species *Clinopodium albanicum* is not questionable. The discovered populations from the area of Demir Hisar (between the villages Velmevci and Zelezneć) (Figure 5) no doubt belong to this species. In this way, the data of Vandas [17, 18] and Šilić [16] for the presence of the *Micromeria bulgarica* (Velen.) Vandas (*Clinopodium dalmaticum* or *Clinopodium dalmaticum* subsp. *bulgaricum*) in the listed localities on the territory of the Republic of Macedonia are revised.

In addition, we provide a diagnostic description of the population of the *Clinopodium albanicum* from the following locality: Republic of Macedonia: Demir Hisar: between the villages Velmevci and Zelezneć, along the road Kičevo-Demir Hisar, on limestone, 41° 21’06.14 “N; 21° 02 ’29.80 °E, 853 m; 10/22/2017 (leg. et det. V. Matevski (MKNH).

Perennial plant. Stems up to 40–50 cm, erect or ascending from the base, in the upper part branched, obtuse 4-angular, with very dense, short deflexed hairs, often with a glandular hairs. Leaves ovate to ovate-elongated, (10) 13–25 (38) mm long, (5) 7–10 (17) mm wide, obtuse, gradually cuneate at base, petiole 4–9 mm long, entire or shallow dentate with 1–4 teeth on each side, with 3–4 lateral veins, both sides with short puberulent hairs, short stalked glands and glandular-punctate. Flowers shortly pedicellate, cymes many-flowered grouped in terminal inflorescences that are initially compressed, later are fragmented and branched. Bracts linear-subsulate. Calyx (2) 2.2–2.8 mm long, obconical with 13 clearly distinctive veins, along the veins of the calyx there are simple retrorse hairs, between the veins with the short stalked glands and glandular-punctate, densely villous in throat, calyx teeth 0.3-0.7 mm long, triangular, about as long as wide. Corolla 6–6.5 mm long, whitish or whitish-violet, outside hairy, 2-lipped, the upper lip entire or shallow bifid, lower lip 3-lobed. Stamens and style exerted out corolla. Nutles obtuse, 1.1–1.2 mm long, yellowish-brown.

НОВ ВИД ЗА ФЛОРАТА НА РЕПУБЛИКА МАКЕДОНИЈА

Владо Матевски

Македонска академија на науките и уметностите, Скопје, Република Македонија

Во текот на флористичките истражувања во западните делови од територијата на Република Македонија (во околината на Демир Хисар, помеѓу селата Велмеци и Железец) е открiven еден нов вид за флората на Република Македонија – *Clinopodium albanicum* (Griseb. ex K. Malý) Melnikov [*Micromeria albanica* (K. Malý) Šilić, *Satureja albanica* Griseb. ex K. Malý], досега непознат за нејзината територија. Во трудот се разгледува проблемот околу определението на таксономскиот статус на овој вид и неговата поврзаност со таксоните *Clinopodium dalmaticum* (односно *Clinopodium dalmaticum* subsp. *bulgaricum* = *Micromeria bulgarica* и *Clinopodium serypillifolium*). Анализата на хербарнумскиот материјал од околината на Демир Хисар покажа дека регистрираните популации не можат да се поврзат со видот *Micromeria bulgarica* (Velen.) Vandas (според современите концепции *Clinopodium dalmaticum* или *Clinopodium dalmaticum* subsp. *bulgaricum*), кого Šilić (1979), го наведува за територијата на Република Македонија – Демир Хисар, Усунжа Река и Кривска Река (врз основа на податоците на Vandas, 1905, 1909). Забележлива е големата разлика помеѓу овие два таксони во обликот и влакнетоста на листовите, како и во големината на чашката и обликот на запците на чашката. Како *Clinopodium albanicum* од територијата на Република Македонија чашката е правилна, 2–2,5 мм долга, запците на чашката се триаглеси, со еднаква должина и ширина додека кај *Micromeria bulgarica* (односно *Clinopodium dalmaticum*) од територијата на Бугарија чашката повеќе или помалку е двоусна, подолга од 3 мм, чашките запц се издолжено триаглеси и тие се со долгу зашилен вид.

Ключни зборови: флора; Република Македонија; хорологија; *Clinopodium albanicum* (Griseb. ex K. Malý) Melnikov
